Decaschistia (Malvaceae) in Thailand

LEENA PHUPHATHANAPHONG*

ABSTRACT. An account of the genus Decaschistia in Thailand is presented.

The genus Decaschistia comprises ca. 16 species distributed from India through southeast Asia to Australia. The following account is presented as a precursor to a treatment for the Flora of Thailand.

DECASCHISTIA

Wight & Arn., Prod. 1: 52. 1834.

Small shrubs or herbs. Leaves simple, entire, serrate to shallowly lobed; stipules 1–3. Flower solitary, axillary or clustered at the end of the branches; epicalyx 8–10-lobed, persistent; calyx 5-lobed; petals 5, united at the base of the staminal tube. Stamens numerous, united in short column; anthers not sessile, ovary hairy; style with 8–10 branches, glandular; stigma capitate. Fruit capsular, globose; depressed, 8–10-locular, dehiscent. Seeds 1 per locule, reniform.

KEY TO THE SPECIES

1. Leaves glabrous, prominently reticulate on the upper surface, linear, margin revolute; flowers red
   1. D. intermedia

1. Leaves hairy, not prominently reticulate on the upper surface, rarely linear; flowers pink or yellow
   2. Upper surface of leaves minute stellate hairy, scabrous, rarely glabrous, flowers yellowish pink or pale pink
      2. D. parviflora
      3. D. siamensis

Small shrub, 10–60 cm high. Leaves linear, 2.2–9 by 0.3–1 cm, apex acute, mucronate to obtuse, margin entire, revolute, base cuneate, narrowly cordate to rounded, upper surface entirely glabrous, prominently reticulate, midrib sunken, lower surface densely pale stellate hairy, petiole subsessile to ca. 1 cm long. Flowers axillary, solitary in upper leaf axils and in terminal racemes, ca. 6 cm in diameter; pedicel hairy; calyx 5-lobed, 6–9 mm, lobes acute to acuminate, 1-nerved, outside stellately hairy, inside with appressed

*The Forest Herbarium, Royal Forest Department, Bangkok 10900, Thailand.
simple hairs; petals 5, obliquely obovate, ca. 3 by 1–1.5 cm, red. Stamens many (ca. 22); free part of filaments slender, 3–5 mm long; anthers red. Style slender, glandular hairy, ca. 1 cm longer than stamens, branches 8, 2–3 mm long; stigma hairy. Fruit ca. 8 mm in diameter, 8-locular.

**Thailand.**—EASTERN: Surin, Ubon Ratchathani (Noaw-ngam forest, Ban Bong); SOUTH-EASTERN: Trat (Khlong Kut, Khlong Yai.)

**Distribution.**—Cambodia.

**Ecology.**—Scattered in moist places on sandstone plateau, open sandy areas in scrub forest, open dipterocarp forest, pine-dipterocarp forest and in paddy field, 100–150 m.

**Vernacular.**—Ya ki on (เนื้อฝัก) (Loei); hua i uk (หัวอีคำ) (Yao-Nakhon Phanom).

Small shrub, 0.3–1 m high, branched. Leaves narrowly oblong, oblong, oblong-ovate to lanceolate, 2–12 by 0.5–5 cm, apex acute to obtuse, margin entire, scarcely dentate or serrate, base rounded, sometimes cuneate to slightly cordate; basal nerves 1–3(–5), penninerved along midrib; upper surface scabrous with appressed, minute, stellate hairs, rarely glabrous, lower surface densely pale hairy; petiole 0.5–4 cm long. Flowers axillary in upper part of stem and in terminal racemes; pedicels stiff, epicalyx 10-lobed, linear, 3–5 mm long, outside stellately hairy, inside glabrous except near apex, thin hairy; calyx 5-lobed, ca. 1 cm long, lobe acuminate, 1-nerved, outside stellately hairy, inside appressed hairy; petals 5, obliquely obovate, 2.3–5.5 by 1.5–2 cm, longitudinally veined, white, yellowish pink, pale pink to red, base whitish, outside stellately hairy, inside glabrous; staminal tube cylindric, 5–8 mm long. Stamens many, from middle of the tube through the apex, filament ca. 3 mm long, anther U-shaped, yellow. Style much longer than the staminal tube, apex 8–10 branched, ca. 1.5 cm long, styles and stigmas red. Fruit ca. 1.5 cm in diameter depressed, densely hairy, 10-lobular; seeds densely appressed hairy.

**Thailand.**—NORTHERN: Nakhon Sawan (Hua Wai), Sukhothai; NORTH EASTERN: Sakon Nakhon, Kalasin (Phu Sing), Khon Kaen (Sawang Daen Din); EASTERN: Chaiyaphum (Pa khok Yai Chiu), Nakhon Ratchasima (Ban Chum Saeng, Lat Bua Kao, Muang Phon, Pak Thong Chai), Buri Ram, Surin (Khao Sawai); SOUTH-WESTERN: Uthai Thani (Ban Rai, Huai Kha Khaeng), Phetchaburi (Cha-um, Nang Ya Pong); CENTRAL: Saraburi; SOUTH-EASTERN: Prachin Buri (Krabin Buri, Wattana Nakhon).

**Distribution.**—Cambodia and Laos.

**Ecology.**—Found in evergreen forest, deciduous forest, mixed deciduous forest, common in scrub forest, on roadside in sandy soil, and open areas. Altitude from sea level to 200 m.

**Vernacular.**—Thong phan dun (นกอินทรี) (Ratchaburi), kai u (ไก่) (Nakhon Sawan), hua kai oak (หว่ากิ้งกอง) (Nakhon Ratchasima), chaba ng (ช้างเผือก) (Central).
Note.—Plants from southwestern Thailand have leaves that are glabrous on upper surface.

Shrub, 0.5–2 m. tall, all parts covered with yellowish stellate hairs. Leaves ovate, oblong-ovate, on upper part of stem narrowly oblong, 3–13.5 by 1.5–7 cm, apex acute to obtuse, margin entire, irregularly serrulate to dentate, shallowly lobed, base rounded, basal nerves 3–5, nerves 3–5 along midrib, softly stellately hairy on both surfaces densely hairy beneath, with a linear gland at the base of midrib on lower surface, in young leaves the gland often extending down to the apex of petiole; petiole 1–4 cm. long; stipules filiform, 1–3 in each side, 5–18 mm, unequal. Flowers axillary, solitary or in a terminal raceme; bracts linear, with a linear gland similar to the leaves; racemes, clustered or elongate, up to 40 cm long; pedicels 3–5 mm., increasing in fruit; epicalyx 9–10-lobed, linear, acute, 4–10 by 1–2 mm, connate at the base; calyx cup-shaped, 9–15 mm long, divided to half way into 5 lobes, lobes broadly triangular 4–8 mm wide, apex acute to acuminate, slightly thickened by yellowish long hairs along the midrib and margin; petals 5, obliquely obovate ca. 5 by 3.5 cm, longitudinally veined, yellow, base deep maroon inside, membranous; staminal tube cylindrical. Stamens many, from the base to the apex, filament 1 mm. long, anthers U-shaped. Style longer than the staminal tube, divided into 10 branches; stigmas papillose. Fruit globose, 1.5 cm. in diameter, depressed, densely yellowish to light brown woolly, 10-locular; seeds ca. 4 by 3 mm, glabrous, brown.

Thailand.—NORTH-EASTERN: Nakhon Phanom (Phu Wat), Sakon Nakhon (Phu Phan), Surin; CENTRAL: Saraburi; SOUTH-EASTERN: Chonburi (Khao Khiao), Chanthaburi (Pong Namron, Makham).

Distribution.—Endemic to Thailand.

Ecology.—Common scattered in moist evergreen forest also on open rocky ground, in dry places on rock plateau, deciduous forest and along forest margin, alt. to 380 m.

Vernacular.—Po-thai (ป้าหมู), fai phi (ฝ้ายฟ้า) (Chanthaburi).
